

Mastercraft are proud to be associated with the redevelopment of this famous rugby stadium.

The works by the firm included climbing 6 new lift shafts, these are found in the three stands; the Memorial, Aquinas and Grandstand.

The company also formed the basement walls under the Aquinas Stand that houses the new world class gym facility used by the Ulster Rugby elite squad.

Mastercraft Construction also shuttered the retaining walls throughout the project. These support the stepped terraces and help carry the precast units carrying the stadium seating.

The stepped terraces were also formed in concrete and are found on all four sides of the stadium. These new terraces give the supporters great views of all the action on the pitch.
